1 build 123: \* Fixed a bug in the Microsoft Visual C++ Redistributable. Revo Uninstaller Pro version 3.1.5. Revo Uninstaller Pro is a program to remove unwanted programs, pre-installed applications and other content.. 8.4.0.0.2-32bit. The software is an uninstaller for Microsoft Windows. Revo Uninstaller Pro 2016...Q: Keeping a running total when two tables are updated I have a table products, which has columns for id, price, store\_id. I have another table stores, which has columns for id, name, etc. I would like to keep a running total of the sum of all the price of products in a specific store. I can get this to work fine with a simple insert into query as follows. insert into stores values (3, 'Test Store', 100) insert into products values (10,1,100) insert into products values (20,1,100) insert into products values (30,1,100) select id, sum(price) as price from products group by store\_id But if I were to update one of the two tables it would not keep the running total. Is there any way to make it keep the running total? A: Postgres has the distinct on clause for this, which tells the optimiser to keep only one instance of a row in the result set.

---

You can use it like this: `SELECT DISTINCT ON (store_id) id, SUM(price) AS price FROM products GROUP BY store_id, id;`  
Demo: The ordering on the id also makes sure you see only the updated row. The ORDER BY clause would be redundant with DISTINCT ON. If you can be sure there won't be an UPDATE on stores, you can omit the ORDER BY clause: If you're concerned about the results that would show up without ORDER BY, don't be - it will give you the 82157476af
